**EARLY HUMANS:** (This Great Courses series, produced in 2023, relies on the most up-to-date science, including DNA, and will give you insights that you probably did not have before.) You and the other 8 billion humans alive today are members of the only species that has survived in the genus *Homo* since its 2.5 million year evolutionary journey began. Many other species we know of and perhaps dozens yet to be discovered have all come and gone. Who were these long ago ancestors? Where and how did they live and die? And how are we even able to learn about these humans, some of whom became extinct millions of years ago? Professor Suzanne Pilar Birch shares her expertise and passion for discovery as she peels back the years to expose the emergence and lives of early humans in *Early humans: Ice, Stone, and Survival*.
